# Widget Option : Cursor

- The Text insertion cursor options are

- Wherever the cursor is present the text will be inserted over there thus the cursor acts as an insertion cursor

- Insertebackground means when we select the text its background colour changes

- Insertwidth is given to set the width of the cursor

- The border around the cursor is given by the insertborderwidth option

```python
win = Tk()
win.title('My First Application')
win.geometry('600x400')

e1 = Text(win, insertbackground='red', insertwidth=15, insertborderwidth=5)
e1.pack()

win.mainloop()
```

- The blinking time of the cursor can also be set using insertofftime and insertontime

```python
from tkinter import *
from tkmacosx import *

win = Tk()
win.title('My First Application')
win.geometry('600x400')

e1 = Text(win, insertbackground='red', insertwidth=15, insertborderwidth=5, insertontime=100)
e1.pack()

win.mainloop()
```

- If you want to make the cursor invisible you can do it by setting the on time to zero

- We can also change the cursor style

- For example , this option works for all the widget

```
e1 = Text(win, cursor='boat')
e1.pack()
```
