

Operators (Arithmetic operators)

- These operator is use to perform arithmetic operation like addition , sub , div etc
- There are 7 athematic operators

a = 15 b = 4
c = a+b output : 19
c = a*b output : 60
c =a-b. Output : 11

c=a**b

- Now the question is what is **
- It is said as power

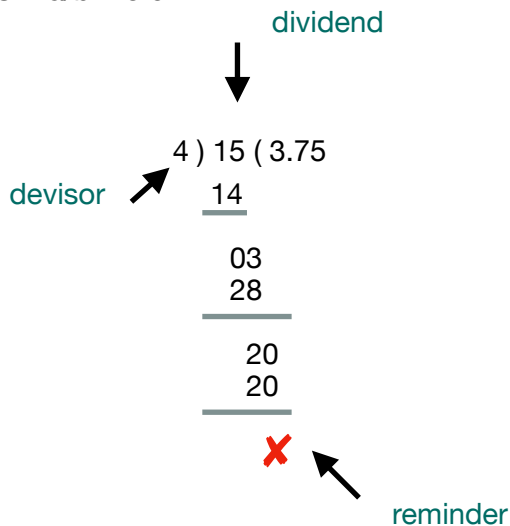

c= a**b

(15)⁴

= 50,625

Division (/) :

C = a/b = 3.5

Float division (//) :

- If we don't want in float form we want in int form then we will use float division

C = a // b

= 3

Mod (%) :

- This will divide . It will not take quotient it will take remainder

a = 15 b = 4

Z = x//y = 3

Z = x % y = 0
